

Photonic Measurements of Firn and Ice Structure

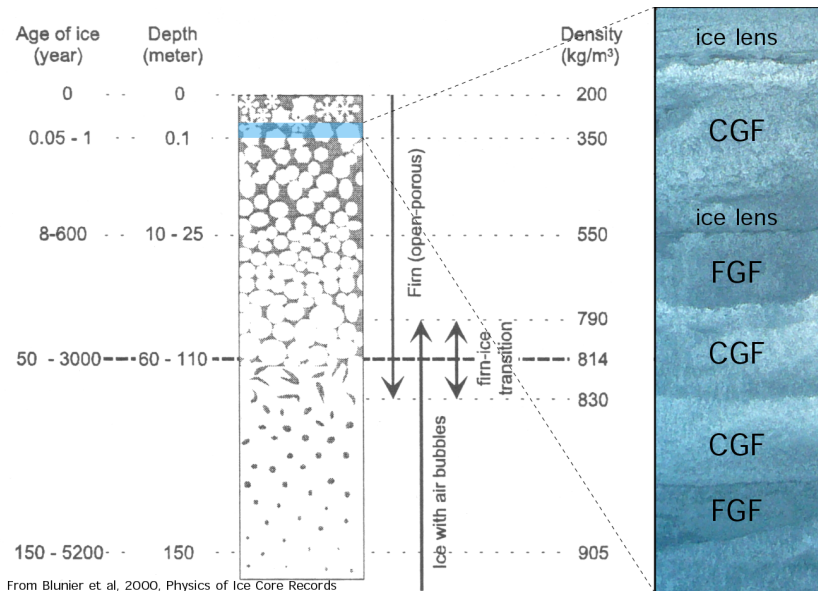

An aerial photograph of a vast, snow-covered landscape. The terrain is uneven, with numerous small mounds and depressions. In the foreground, a large, prominent snowdrift is visible, showing distinct horizontal layers or striations. The sky is a clear, pale blue.

From snow to ice: firn densification

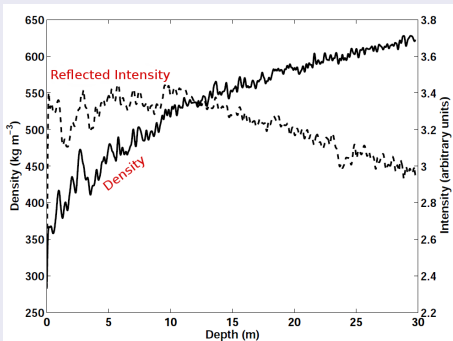

From Blunier et al, 2000, Physics of Ice Core Records

Observations of MDD: Hawley and Morris (2006)

30 m core at Summit, Greenland

- Borehole wall optical reflectivity
- Neutron scattering density probe
- In-situ, but low resolution

Change in ρ -reflectivity correlation

- Shift in correlation suggests density inversion...
- ... but not supported by subsequent chemistry data

Maine Automated Density Gauge Experiment

Overview

- low energy gamma-ray: optimized for 5-8 cm cores
- pulse mode: well defined nuclear counting uncertainty
- calipers: measure core diameter ± 0.1 mm
- $1 - \sigma$ uncertainty: $\pm 4 \text{ kg m}^{-3}$
- high resolution: 3.3 mm
- throughput: $\sim 1 \text{ m h}^{-1}$
- field-deployable, used for 2 seasons on U.S. ITASE traverse

MADGE sensor head

The NICL Optical Imaging System

A line-scan camera

From McGwire et al, 2008

- dark-field photography: camera perpendicular to illumination
- goal is archival photography, not firn/ice optics measurements
- image brightness: **bulk density and scatterer size** & shape

What do we see?

- variations in grain/bubble size
- ice lenses
- variations in brightness

How to measure?

- cross-core average
- mask core breaks

How to interpret?

- not reflectivity
- not transmission
- need a **model**

Geometric (ray-tracing) optics model of firn

The spherical cow, revisited

ice grains in air (GA)

$$SSA_v = \frac{3\rho}{r_g \rho_{ice}}$$

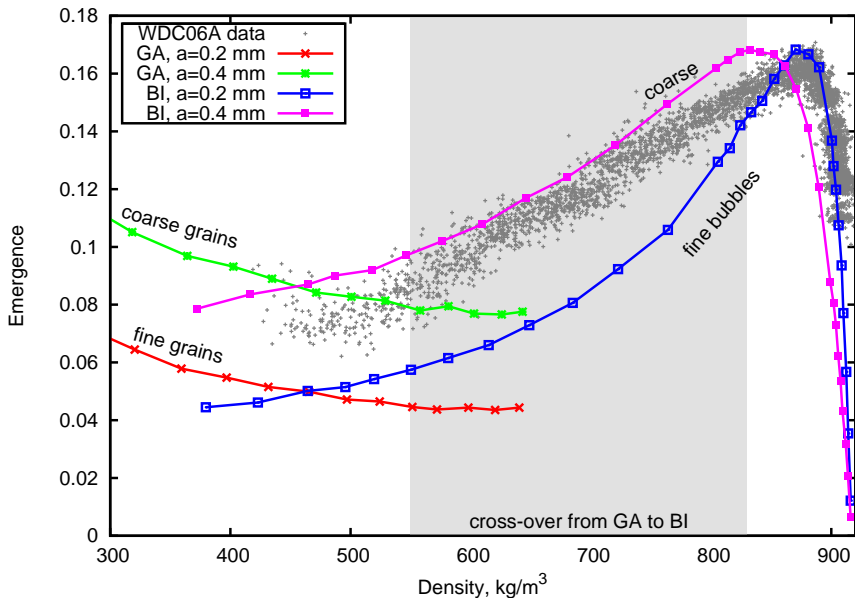

air bubbles in ice (BI)

$$SSA_v = \frac{3}{r_b} \left(1 - \frac{\rho}{\rho_{ice}} \right)$$

Comparison of modeled and measured emergence

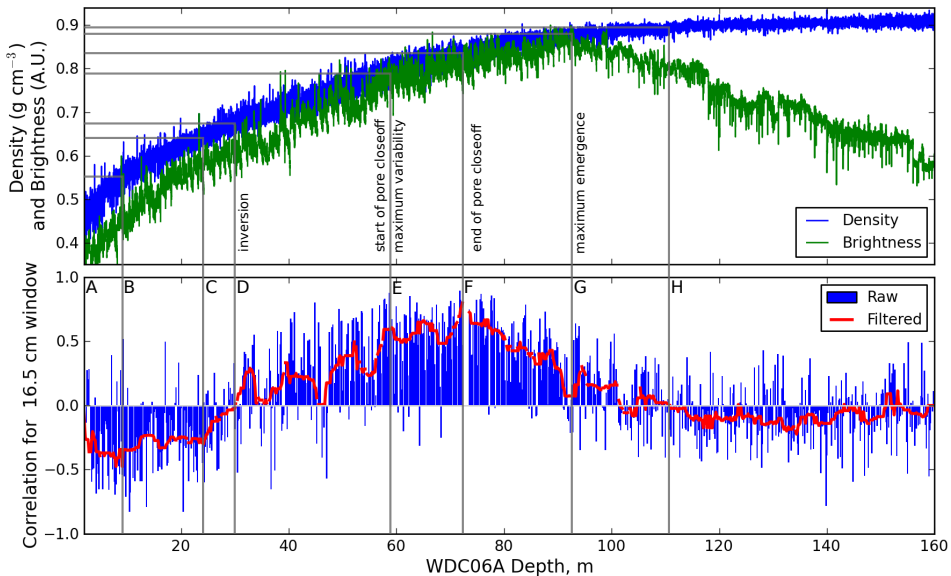

Shallow variability in WDC06A

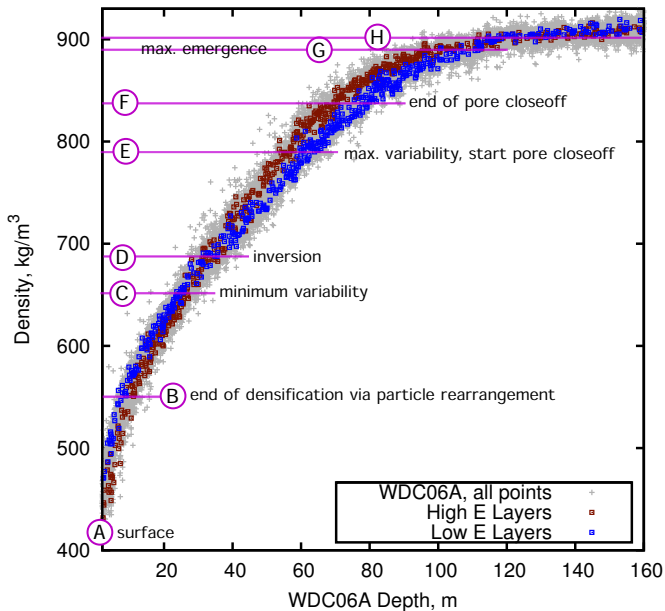

Deep variability in WDC06A

WDC06A overall optical scattering data

Evidence of MDD and density inversion in WDC06A

What is it good for?

Firn Optics & Density Profiles

- Can determine average scatterer size from density and optical scattering data
- High (mm-scale) resolution, non-destructive firn and ice microstructure data
 - In-situ XCT not possible
 - In-situ optical scattering has been done...
 - ...need high resolution, in-situ density probe

Applications

- Improved the utility of line-scan images
- Alternative to XCT for MDD studies
- Field-deployable technique for rapidly quantifying grain size: ground truthing for RADAR-based remote sensing
